

This delta robot is great for pick and place operations. It could be useful for removing objects from a conveyor belt that have been flagged as defective or out of spec, packaging small parts, or food products.

This robot can be moved from place to place very easily and would be perfect for operating on large workpieces that would be extremely hard to move around a robot. i.e boats and airplanes.

This robot has high precision and its ability to rotate the object it picks up makes it perfect for packaging oddly shaped products that would need to be staggered in their packaging.
